Tell Snakemake what files you want to be created

```
rule:
    input: "A.txt", "B.txt", "C.txt"
```

Snakemake determines the dependencies for you

Produce the files you want to have from some intermediate result

```
rule:
    input: "{sample}.inter"
    output: "{sample}.txt"
    shell: "somecommand {input} {output}"
```

Create a needed intermediate result

```
rule:
    input:  "{sample}.in"
    output: "{sample}.inter"
    run:
        somepythoncode()
```

Use wildcards to write general rules for all samples
